

# Stark-Heegner Points

Henri Darmon and Victor Rotger

...

Second Lecture

...

Arizona Winter School

Tucson, Arizona

March 2011

# Summary of the first lecture

Victor described variants of the Heegner point construction based on higher dimensional algebraic cycles: the so-called *Chow-Heegner points*.

Our last two lectures, and the student projects will focus *exclusively* on Chow-Heegner points attached to *diagonal cycles* on triple products of modular curves and Kuga-Sato varieties.

**Goal of this morning's lecture:** indicate how these ostensibly very special constructions fit into the “broader landscape” of *Stark-Heegner points*.

# Summary of the first lecture

... otherwise the less experienced participants might feel like the protagonists in the tale of the elephant and the six blind men!

# What is a Stark-Heegner point?

**Executive summary:** Stark-Heegner points are points on elliptic curves arising from (*not necessarily algebraic*) cycles on modular varieties.

# What is a Stark-Heegner point?

**Executive summary:** Stark-Heegner points are points on elliptic curves arising from (*not necessarily algebraic*) cycles on modular varieties.

## A prototypical example: points arising from ATR cycles

**Motivation.** Thanks to Heegner points, we know:

$$\text{ord}_{s=1} L(E, s) \leq 1 \implies \text{rank}(E(\mathbb{Q})) = \text{ord}_{s=1} L(E, s),$$

for all elliptic curves  $E/\mathbb{Q}$ . (Gross-Zagier, Kolyvagin.)

By work of Zhang and his school, exploiting Heegner points on Shimura curves, similar results are known for *many* elliptic curves over totally real fields...

but not for all of them!!

# The mysterious elliptic curves

$F$  = a real quadratic field;

$E$  = elliptic curve of conductor 1 over  $F$ ;

$\chi : \text{Gal}(K/F) \longrightarrow \pm 1$  = quadratic character of  $F$ .

**Question:** Show that

$$\text{ord}_{s=1} L(E/F, \chi, s) \leq 1 \implies \text{rank}(E^\chi(F)) = \text{ord}_{s=1} L(E/F, \chi, s).$$

# The mysterious elliptic curves

$F$  = a real quadratic field;

$E$  = elliptic curve of conductor 1 over  $F$ ;

$\chi : \text{Gal}(K/F) \longrightarrow \pm 1$  = quadratic character of  $F$ .

**Question:** Show that

$$\text{ord}_{s=1} L(E/F, \chi, s) \leq 1 \implies \text{rank}(E^\chi(F)) = \text{ord}_{s=1} L(E/F, \chi, s).$$

# The mysterious elliptic curves

Theorem (Matteo Longo)

$$L(E/F, \chi, 1) \neq 0 \implies \#E^\chi(F) < \infty.$$

Yu Zhao's PhD thesis (defended March 10, 2011):

Theorem (Rotger, Zhao, D)

If  $E$  is a  $\mathbb{Q}$ -curve, i.e., is isogenous to its Galois conjugate, then

$$\text{ord}_{s=1} L(E/F, \chi, s) = 1 \implies \text{rank}(E^\chi(F)) = 1.$$

We have no idea how to produce a point on  $E^\chi(F)$  in general!

**Logan, D, (2003):** We can nonetheless propose a *conjectural formula* to compute it in practice, via *ATR cycles*.

# The mysterious elliptic curves

Theorem (Matteo Longo)

$$L(E/F, \chi, 1) \neq 0 \implies \#E^\chi(F) < \infty.$$

## ATR cycles

Let  $Y$  be the (open) *Hilbert modular surface* attached to  $E/F$ :

$$Y(\mathbb{C}) = \mathbf{SL}_2(\mathcal{O}_F) \backslash (\mathcal{H}_1 \times \mathcal{H}_2).$$

Let  $\gamma \in \mathbf{SL}_2(\mathcal{O}_F)$ , with a (unique) fixed point  $\tau_1 \in \mathcal{H}_1$ .

Then the field  $K$  generated by the eigenvalues of  $\gamma$  is an ATR extension of  $F$ .

To each  $\gamma$ , we will attach a cycle  $\Delta_\gamma \subset Y(\mathbb{C})$  of real dimension one which “behaves like a Heegner point”.

## ATR cycles

Let  $Y$  be the (open) *Hilbert modular surface* attached to  $E/F$ :

$$Y(\mathbb{C}) = \mathbf{SL}_2(\mathcal{O}_F) \backslash (\mathcal{H}_1 \times \mathcal{H}_2).$$

Let  $\gamma \in \mathbf{SL}_2(\mathcal{O}_F)$ , with a (unique) fixed point  $\tau_1 \in \mathcal{H}_1$ .

Then the field  $K$  generated by the eigenvalues of  $\gamma$  is an ATR extension of  $F$ .

## Oda's conjecture on periods

For any closed 2-form  $\omega_G \in \Omega_G$ , let  $\Lambda_G$  denote its set of periods, as in Kartik's lectures:

$$\Lambda_G = \left\{ \int_{\gamma} \omega_G, \quad \gamma \in H_2(X(\mathbb{C}), \mathbb{Z}) \right\}$$

Conjecture (Oda, 1982)

*For a suitable choice of  $\omega_G$ , we have  $\mathbb{C}/\Lambda_G \sim E(\mathbb{C})$ .*

## Oda's conjecture on periods

For any closed 2-form  $\omega_G \in \Omega_G$ , let  $\Lambda_G$  denote its set of periods, as in Kartik's lectures:

$$\Lambda_G = \left\{ \int_{\gamma} \omega_G, \quad \gamma \in H_2(X(\mathbb{C}), \mathbb{Z}) \right\}.$$

Conjecture (Oda, 1982)

*For a suitable choice of  $\omega_G$ , we have  $\mathbb{C}/\Lambda_G \sim E(\mathbb{C})$ .*

## Points attached to ATR cycles

$$P_{\gamma}^?(G) := \text{AJ}(\Delta_{\gamma})(\omega_G) := \int_{\partial^{-1}\Delta_{\gamma}} \omega_G \in \mathbb{C}/\Lambda_G = E(\mathbb{C}).$$

$$\Gamma_{\text{trace}=t} = (\Gamma\gamma_1\Gamma^{-1}) \cup \dots \cup (\Gamma\gamma_h\Gamma^{-1}).$$

Conjecture (Logan, D, 2003)

*The points  $P_{\gamma_j}^?(G)$  belongs to  $E(H) \otimes \mathbb{Q}$ , where  $H$  is a specific ring class field of  $K$ . They are conjugate to each other under  $\text{Gal}(H/K)$ , and the point  $P_K^?(G) := P_{\gamma_1}^?(G) + \dots + P_{\gamma_h}^?(G)$  is of infinite order if and only if  $L'(E/K, 1) \neq 0$ .*

## Points attached to ATR cycles

$$P_{\gamma}^?(G) := \text{AJ}(\Delta_{\gamma})(\omega_G) := \int_{\partial^{-1}\Delta_{\gamma}} \omega_G \in \mathbb{C}/\Lambda_G = E(\mathbb{C}).$$

$$\Gamma_{\text{trace}=t} = (\Gamma\gamma_1\Gamma^{-1}) \cup \dots \cup (\Gamma\gamma_h\Gamma^{-1}).$$

### Conjecture (Logan, D, 2003)

*The points  $P_{\gamma_j}^?(G)$  belongs to  $E(H) \otimes \mathbb{Q}$ , where  $H$  is a specific ring class field of  $K$ . They are conjugate to each other under  $\text{Gal}(H/K)$ , and the point  $P_K^?(G) := P_{\gamma_1}^?(G) + \dots + P_{\gamma_h}^?(G)$  is of infinite order if and only if  $L'(E/K, 1) \neq 0$ .*

# Stark-Heegner points attached to real quadratic fields

ATR points are defined over abelian extensions of a quadratic ATR extension  $K$  of a real quadratic field  $F$ .

There is a second setting, equally fraught with mystery, involving an elliptic curve  $E/\mathbb{Q}$  over  $\mathbb{Q}$  and class fields of *real quadratic fields*.

**Simplest case:**  $E/\mathbb{Q}$  is of prime conductor  $p$ , and  $K$  is a real quadratic field in which  $p$  is inert.

$$\mathcal{H}_p = \mathbb{P}_1(\mathbb{C}_p) - \mathbb{P}_1(\mathbb{Q}_p)$$

# Computing Stark-Heegner points attached to real quadratic fields

There are fantastically efficient *polynomial-time* algorithms for calculating Stark-Heegner points, based on the ideas of Glenn Stevens and Rob Pollack. (Cf. their AWS lectures.)

## Drawback of Stark-Heegner vs Chow-Heegner points

They are completely mysterious and the mechanisms underlying their algebraicity are poorly understood.

## Advantage of Stark-Heegner vs Chow-Heegner points

They are completely mysterious and the mechanisms underlying their algebraicity are poorly understood.

## New cases of the BSD conjecture?

Theorem (Bertolini, Dasgupta, D + Longo, Rotger, Vigni)

*Assume the conjectures on Stark-Heegner points attached to real quadratic fields (in the stronger, more precise form given in Samit Dasgupta's PhD thesis). Then*

$$L(E/K, \chi, 1) \neq 0 \implies (E(H) \otimes \mathbb{C})^{\chi} = 0,$$

*for all  $\chi : \text{Gal}(H/K) \rightarrow \mathbb{C}^{\times}$  with  $H$  a ring class field of the real quadratic field  $K$ .*

**Question.** Can we control the arithmetic of  $E$  over ring class fields of real quadratic fields *without* invoking Stark-Heegner points?

## New cases of the BSD conjecture?

Theorem (Bertolini, Dasgupta, D + Longo, Rotger, Vigni)

*Assume the conjectures on Stark-Heegner points attached to real quadratic fields (in the stronger, more precise form given in Samit Dasgupta's PhD thesis). Then*

$$L(E/K, \chi, 1) \neq 0 \implies (E(H) \otimes \mathbb{C})^{\chi} = 0,$$

*for all  $\chi : \text{Gal}(H/K) \rightarrow \mathbb{C}^{\times}$  with  $H$  a ring class field of the real quadratic field  $K$ .*

**Question.** Can we control the arithmetic of  $E$  over ring class fields of real quadratic fields *without* invoking Stark-Heegner points?

# Our goal for the AWS

Before seriously attacking the study of  $p$ -adic deformations of diagonal cycles and their (eventual) connection with Stark-Heegner points, it is natural to make a careful study of diagonal cycles and their arithmetic properties.

Because of our predilection for the BSD conjecture—and because elliptic curves are most amenable to computer calculation—we are interested in settings where these diagonal cycles give rise to Chow-Heegner points on elliptic curves, as described in Victor's first lecture.

The calculation of these Chow-Heegner points will be the focus of the last two lectures by Victor and me, and of the AWS student projects.
