

# PERIOD RINGS AND PERIOD SHEAVES

## 1. BACKGROUND STORY

The starting point of  $p$ -adic Hodge theory is the comparison conjectures (now theorems) between  $p$ -adic étale cohomology, de Rham cohomology, and (log-)crystalline cohomology.

Throughout the notes,  $K$  is a finite extension of  $\mathbb{Q}_p$  with residue field  $k$ . Let  $W(k)$  be the Witt vectors with coefficients in  $k$  and let  $K_0 = \text{Frac } W(k)$ .

**Theorem 1.1.** (*Hodge-Tate comparison*)

Let  $X$  be a proper smooth variety over  $K$ . There exists a canonical isomorphism

$$H_{\text{ét}}^n(X_{\overline{K}}, \mathbb{Q}_p) \otimes_{\mathbb{Q}_p} \mathbb{C}_p \cong \bigoplus_{0 \leq i \leq n} H^{n-i}(X, \Omega_{X/K}^i) \otimes_K \mathbb{C}_p(-i)$$

compatible with  $G_K$ -actions.

**Theorem 1.2.** (*de Rham comparison*)

Let  $X$  be a proper smooth variety over  $K$ . There exists a canonical isomorphism

$$H_{\text{ét}}^n(X_{\overline{K}}, \mathbb{Q}_p) \otimes_{\mathbb{Q}_p} B_{\text{dR}} \cong H_{\text{dR}}^n(X/K) \otimes_K B_{\text{dR}}$$

compatible with  $G_K$ -actions and filtrations.

**Theorem 1.3.** (*crystalline comparison*)

Let  $X$  be a proper smooth variety over  $K$ . Suppose  $X$  has a proper smooth model  $\mathfrak{X}$  over  $\mathcal{O}_K$ . Let  $X_0$  denote the special fiber of  $\mathfrak{X}$ . There exists a canonical isomorphism

$$H_{\text{ét}}^n(X_{\overline{K}}, \mathbb{Q}_p) \otimes_{\mathbb{Q}_p} B_{\text{crys}} \cong H_{\text{crys}}^n(X_0/W(k)) \otimes_{W(k)} B_{\text{crys}}$$

compatible with  $G_K$ -actions, Frobenius actions, and filtrations.

There is also a semistable comparison relating  $p$ -adic étale cohomology to log-crystalline cohomology.

The purpose of these notes is to construct and study various *period rings* including  $B_{\text{dR}}$  and  $B_{\text{crys}}$ . Good references for an introduction to  $p$ -adic Hodge theory include [BC], [FO], and [Ber]. The problems and examples here are by no means original, most of which are inspired from literatures mentioned above.

## 2. WITT VECTORS

**Definition 2.1.** Let  $A$  be a topological ring and let  $A \supset I_1 \supset I_2 \supset \dots$  be a decreasing chain of ideals. Assume  $A/I_1$  is an  $\mathbb{F}_p$ -algebra and  $I_n \cdot I_m \subset I_{n+m}$ . The topology on  $A$  is given by  $(I_n)_{n \geq 1}$ .

- (i)  $A$  is called a  *$p$ -ring* if the topology is separated and completed.
- (ii)  $A$  is called a *strict  $p$ -ring* if moreover  $I_n = p^n A$  and  $p$  is not a zero divisor in  $A$ .

Let  $A$  be a  $p$ -ring with perfect residue ring  $R = A/I_1$ . For  $x \in R$  and  $n \in \mathbb{N}$ , let  $x_n = x^{1/p^n}$ . Let  $\hat{x}_n$  be a lift of  $x_n$  to  $A$ . The *Teichmüller lift* of  $x$  is defined to be

$$[x] := \lim_n (\hat{x}_n)^{p^n}$$

In particular, if  $A$  is a strict  $p$ -ring with perfect residue ring  $R$ , then every  $a \in A$  can be uniquely written as

$$a = \sum_{n=0}^{\infty} p^n [a_n]$$

with  $a_n \in R$ . (see Problem 2)

**Theorem 2.2.** *If  $R$  is a perfect ring of characteristic  $p$ . Then there exists a unique strict  $p$ -ring  $W(R)$  with residue ring  $R$ .*

Roughly speaking,  $W(R) = \{ \sum_{n=0}^{\infty} p^n [x_n] \mid x_n \in R \}$ . For an explicit description of  $W(R)$ , see Problem 4.

**Theorem 2.3.** *(Universality)*

*Let  $R_0$  be a perfect ring of characteristic  $p$ . Let  $A$  be any  $p$ -ring with residue ring  $R$ . Suppose  $\alpha : R_0 \rightarrow R$  is a ring homomorphism and  $\tilde{\alpha} : R_0 \rightarrow A$  is a multiplicative lift of  $\alpha$ , then there exists a unique homomorphism  $\alpha : W(R_0) \rightarrow A$  such that  $\alpha([x]) = \tilde{\alpha}(x)$ .*

**Remark 2.4.** Witt vectors can be defined for more general rings, not necessarily  $\mathbb{F}_p$ -algebras. For details, we refer to [Ser].

**Problem 1.** Which of the following rings are  $p$ -rings? Strict  $p$ -rings?

- (a)  $\mathcal{O}_K$  (where  $K/\mathbb{Q}_p$  is a finite extension.)
- (b)  $\mathcal{O}_{\bar{K}}$
- (c)  $\mathcal{O}_{\mathbb{C}_p}$
- (d)  $\mathcal{O}_K[[X_j^{1/p^\infty}]] = \varprojlim_n (\cup_{m=0}^{\infty} \mathcal{O}_K[X_j^{1/p^m}; j \in J])/p^n$   
( $J$  is any index set).
- (e)  $R^+$  (where  $(R, R^+)$  is a perfectoid algebra of characteristic 0).

**Problem 2.** Let  $A$  be a strict  $p$ -ring with perfect residue ring  $R$ . Show that every  $a \in A$  can be uniquely written as

$$a = \sum_{n=0}^{\infty} p^n [a_n]$$

with  $a_n \in R$ .

**Problem 3.** (Universal Witt polynomials)

Consider strict  $p$ -ring  $S = \mathbb{Z}_p[[X_i^{1/p^\infty}, Y_i^{1/p^\infty}]]_{i \geq 0}$  with residue ring  $\bar{S} = \mathbb{F}_p[X_i^{1/p^\infty}, Y_i^{1/p^\infty}]_{i \geq 0}$ .

(i) Show that there exist polynomials  $P_i, Q_i \in \bar{S}$  such that

$$\begin{aligned} \sum_{i=0}^{\infty} p^i [X_i] + \sum_{i=0}^{\infty} p^i [Y_i] &= \sum_{i=0}^{\infty} p^i [P_i] \\ \left( \sum_{i=0}^{\infty} p^i [X_i] \right) \left( \sum_{i=0}^{\infty} p^i [Y_i] \right) &= \sum_{i=0}^{\infty} p^i [Q_i] \end{aligned}$$

(ii) Calculate  $P_0, P_1, Q_0, Q_1$ .

(iii) Show that  $P_i$ 's and  $Q_i$ 's are universal in the following sense. For any strict  $p$ -ring  $A$  with perfect residue ring  $R$  and any  $x_0, x_1, \dots, y_0, y_1, \dots \in R$ , we have

$$\begin{aligned} \sum_{i=0}^{\infty} p^i [x_i] + \sum_{i=0}^{\infty} p^i [y_i] &= \sum_{i=0}^{\infty} p^i [P_i(x_0, x_1, \dots, y_0, y_1, \dots)] \\ \left( \sum_{i=0}^{\infty} p^i [x_i] \right) \left( \sum_{i=0}^{\infty} p^i [y_i] \right) &= \sum_{i=0}^{\infty} p^i [Q_i(x_0, x_1, \dots, y_0, y_1, \dots)] \end{aligned}$$

**Problem 4.** (Explicit description of  $W(R)$ )

Let  $R$  be a perfect ring of characteristic  $p$ . Suppose  $R$  has a presentation  $R \cong \bar{S}_J/I$  where

$$\bar{S}_J = \mathbb{F}_p[X_J^{1/p^\infty}]$$

for some index set  $J$ , and  $I$  is a perfect ideal of  $\bar{S}_J$ .

- (i) Show that such a presentation always exists.  
 (ii) Consider

$$S_J := \mathbb{Z}_p[[X_J^{1/p^\infty}]]$$

Show that  $W(R) \cong S_J/W(I)$  where

$$W(I) = \left\{ \sum_{i=0}^{\infty} p^i [x_i] \mid x_i \in I \right\}.$$

(iii) Prove Theorem 2.3 using the explicit description above.

**Problem 5.** ( $\mathcal{O}_{\mathbb{C}_p^\flat}$  and  $W(\mathcal{O}_{\mathbb{C}_p^\flat})$ )

Let  $(\mathbb{C}_p^\flat, \mathcal{O}_{\mathbb{C}_p^\flat})$  be the tilt of the perfectoid field  $(\mathbb{C}_p, \mathcal{O}_{\mathbb{C}_p})$  (see [Sch1]). We briefly review the construction here. Consider

$$\mathcal{O}_{\mathbb{C}_p^\flat} := \varprojlim_{x \mapsto x^p} \mathcal{O}_{\mathbb{C}_p}/p$$

equipped with inverse limit topology. This is a perfect ring of characteristic  $p$ . Let  $\mathbb{C}_p^\flat = \text{Frac } \mathcal{O}_{\mathbb{C}_p^\flat}$ . The natural projection gives a multiplicative homeomorphism

$$\varprojlim_{x \mapsto x^p} \mathcal{O}_{\mathbb{C}_p} \xrightarrow{\sim} \varprojlim_{x \mapsto x^p} \mathcal{O}_{\mathbb{C}_p}/p.$$

The inverse is given by

$$\varprojlim_{x \mapsto x^p} \mathcal{O}_{\mathbb{C}_p}/p \rightarrow \varprojlim_{x \mapsto x^p} \mathcal{O}_{\mathbb{C}_p}$$

sending  $x = (x_0, x_1, \dots)$  to  $(x^\#, x^{\#(1)}, x^{\#(2)}, \dots)$  where  $x^{\#(m)} = \lim_{n \rightarrow \infty} \widehat{x}_n^{p^{n-m}}$ . One can define a valuation on  $\mathcal{O}_{\mathbb{C}_p^\flat}$  by  $|x| := |x^\#|_{\mathbb{C}_p}$ .

- (i) Check that  $|\cdot|$  is indeed a non-archimedean valuation on  $\mathcal{O}_{\mathbb{C}_p^\flat}$ . In particular,  $|x + y| \leq \max(|x|, |y|)$ ,  $\forall x, y \in \mathcal{O}_{\mathbb{C}_p^\flat}$ .
- (ii) Check that  $\mathcal{O}_{\mathbb{C}_p^\flat}$  is complete and separated with respect to  $|\cdot|$ .
- (iii) Consider

$$\varepsilon = (1, \zeta_p, \zeta_{p^2}, \dots) \in \varprojlim_{x \mapsto x^p} \mathcal{O}_{\mathbb{C}_p} \cong \mathcal{O}_{\mathbb{C}_p^\flat}$$

For each  $n \in \mathbb{N}$ , calculate  $|\varepsilon^{1/p^n} - 1|$ .

- (iv) Let  $K/\mathbb{Q}_p$  be a finite extension and let  $G_K = \text{Gal}(\overline{K}/K)$ . Then  $\mathcal{O}_{\mathbb{C}_p^\flat}$  is equipped with a natural Frobenius action  $\varphi$  and an action of  $G_K$ . More precisely, for  $x = (x^{(0)}, x^{(1)}, \dots) \in \varprojlim_{x \mapsto x^p} \mathcal{O}_{\mathbb{C}_p} \cong \mathcal{O}_{\mathbb{C}_p^\flat}$ , we define

$$\varphi(x) = ((x^{(0)})^p, (x^{(1)})^p, \dots)$$

and

$$g(x) = (g(x^{(0)}), g(x^{(1)}), \dots), \quad \forall g \in G_K.$$

The  $\varphi$  and  $G_K$  actions also extend naturally to  $W(\mathcal{O}_{\mathbb{C}_p^\flat})$ .

$$\text{Find } (\mathcal{O}_{\mathbb{C}_p^\flat})^{\varphi=1}, (\mathcal{O}_{\mathbb{C}_p^\flat})^{G_K}, W(\mathcal{O}_{\mathbb{C}_p^\flat})^{\varphi=1}, W(\mathcal{O}_{\mathbb{C}_p^\flat})^{G_K}.$$

### 3. DE RHAM PERIOD RING $B_{\text{dR}}$

Consider the following  $G_K$ -equivariant ring homomorphism

$$\begin{aligned} \theta : W(\mathcal{O}_{\mathbb{C}_p^\flat}) &\rightarrow \mathcal{O}_{\mathbb{C}_p} \\ \sum_{i=0}^{\infty} p^i [x_i] &\mapsto \sum_{i=0}^{\infty} p^i x_i^\# \end{aligned}$$

It turns out  $\ker(\theta)$  is a principle ideal generated by  $\xi = [p^\flat] - p$ , where

$$p^\flat = (p, p^{1/p}, p^{1/p^2}, \dots) \in \varprojlim_{x \mapsto x^p} \mathcal{O}_{\mathbb{C}_p} \cong \mathcal{O}_{\mathbb{C}_p^\flat}.$$

Define  $B_{\text{dR}}^+$  to be the  $\ker(\theta)$ -adic completion of  $W(\mathcal{O}_{\mathbb{C}_p^\flat})[\frac{1}{p}]$ ; i.e.,

$$B_{\text{dR}}^+ = \varprojlim_n W(\mathcal{O}_{\mathbb{C}_p^\flat})[\frac{1}{p}] / (\ker \theta)^n.$$

The natural projection induces

$$\theta_{\text{dR}}^+ : B_{\text{dR}}^+ \rightarrow W(\mathcal{O}_{\mathbb{C}_p^\flat})[\frac{1}{p}] / (\ker \theta) \cong \mathbb{C}_p.$$

In particular,  $B_{\text{dR}}^+$  is a complete discrete valuation ring with maximal ideal  $\mathfrak{m}_{B_{\text{dR}}^+} = (\ker \theta)$  and residue field  $\mathbb{C}_p$ . We temporarily equip  $B_{\text{dR}}^+$  with the discrete valuation ring topology. (See Problem 11 for a “better” topology.)

Let  $\varepsilon$  be the same as in Problem 5(iii). Consider the element

$$t = \log[\varepsilon] = \sum_{n=1}^{\infty} (-1)^{n-1} \frac{([\varepsilon] - 1)^n}{n}.$$

One can check that  $t$  converges to a uniformizer in  $B_{\text{dR}}^+$ . Moreover,  $t$  has the nice property that

$$g(t) = \chi(g)t, \quad \forall g \in G_K$$

where  $\chi$  is the cyclotomic character.

Finally, we define  $B_{\text{dR}} = B_{\text{dR}}^+[\frac{1}{t}] = \text{Frac } B_{\text{dR}}^+$ , which carries a natural  $G_K$ -action. One can prove  $B_{\text{dR}}^{G_K} = K$ . In addition, one can put a  $G_K$ -stable filtration on  $B_{\text{dR}}$  by setting

$$\text{Fil}^n B_{\text{dR}} := t^n B_{\text{dR}}^+ = \mathfrak{m}_{B_{\text{dR}}^+}^n, \quad n \in \mathbb{Z}.$$

However, the  $\varphi$ -action on  $W(\mathcal{O}_{\mathbb{C}_p^b})[\frac{1}{p}]$  does not extend to  $B_{\text{dR}}$ .

**Problem 6.** If we identify  $W(\mathcal{O}_{\mathbb{C}_p^b})$  with  $(\mathcal{O}_{\mathbb{C}_p^b})^{\mathbb{N}}$  and equip the product of valuation topology from  $\mathcal{O}_{\mathbb{C}_p^b}$ , show that  $\theta : W(\mathcal{O}_{\mathbb{C}_p^b}) \rightarrow \mathcal{O}_{\mathbb{C}_p}$  is open.

**Problem 7.** Let  $k$  be the residue field of  $K$ . Show that  $\theta$  is actually a morphism of  $W(\bar{k})$ -algebras with the natural  $W(\bar{k})$ -structures on both sides.

**Problem 8.** For  $\alpha \in W(\mathcal{O}_{\mathbb{C}_p^b})$ , let  $\bar{\alpha}$  denote the reduction of  $\alpha \bmod p$ . Show that  $\alpha \in \ker(\theta)$  is a generator if and only if  $|\bar{\alpha}| = 1$ . In particular,  $\xi$  is a generator.

**Problem 9.** Show that  $\varphi$ -action on  $W(\mathcal{O}_{\mathbb{C}_p^b})[\frac{1}{p}]$  does not extend to  $B_{\text{dR}}^+$ .

**Problem 10.** Show that  $[p^b]$  is invertible in  $B_{\text{dR}}^+$ .

**Problem 11.** This is a famous exercise in [BC]. We put a new topological ring structure on  $W(\mathcal{O}_{\mathbb{C}_p^b})[\frac{1}{p}]$  which extends to one on  $B_{\text{dR}}^+$  such that the quotient topology on  $\mathbb{C}_p$  through  $\theta_{\text{dR}}^+$  is the natural valuation topology!

(i) For any open ideal  $\mathfrak{a} \subset \mathcal{O}_{\mathbb{C}_p^b}$  and  $N \geq 0$ , consider

$$U_{N,\mathfrak{a}} := \bigcup_{j > -N} (p^{-j} W(\mathfrak{a}^{p^j}) + p^N W(\mathcal{O}_{\mathbb{C}_p^b})) \subset W(\mathcal{O}_{\mathbb{C}_p^b})[\frac{1}{p}].$$

Prove that  $U_{N,\mathfrak{a}}$  is a  $G_K$ -stable  $W(\mathcal{O}_{\mathbb{C}_p^b})$ -submodule of  $W(\mathcal{O}_{\mathbb{C}_p^b})[\frac{1}{p}]$ .

(ii) Define a topological ring structure on  $W(\mathcal{O}_{\mathbb{C}_p^b})[\frac{1}{p}]$  by making  $U_{N,\mathfrak{a}}$ 's a base of open neighborhoods of 0. Show that the topological ring structure is well-defined and the  $G_K$ -action is continuous under this topology.

- (iii) Show that  $\theta : W(\mathcal{O}_{\mathbb{C}_p^b})[\frac{1}{p}] \rightarrow \mathbb{C}_p$  is continuous and open, where  $W(\mathcal{O}_{\mathbb{C}_p^b})[\frac{1}{p}]$  is equipped with the new topology and  $\mathbb{C}_p$  with valuation topology.
- (iv) Show that  $(\ker \theta)^n = \xi^n W(\mathcal{O}_{\mathbb{C}_p^b})[\frac{1}{p}]$  are closed ideals of  $W(\mathcal{O}_{\mathbb{C}_p^b})[\frac{1}{p}]$ .
- (v) Equip  $B_{\text{dR}}^+$  with the inverse limit topology of the quotient topologies on each  $W(\mathcal{O}_{\mathbb{C}_p^b})[\frac{1}{p}]/(\ker \theta)^n$ . Verify that the quotient topology on  $\mathbb{C}_p$  through  $\theta_{\text{dR}}^+ : B_{\text{dR}}^+ \rightarrow \mathbb{C}_p$  coincides with the valuation topology.
- (vi) Show that the new topology on  $B_{\text{dR}}^+$  is complete.

**Problem 12.** Prove that  $g(t) = \chi(g)t$  for all  $g \in G_K$ .

(Hint: Show that both sides are equal to “ $\log([\varepsilon]^{\chi(g)})$ ”. This expression does not converge in discrete valuation topology, but converges in the new topology constructed in Problem 11.)

**Problem 13.** ( $G_K$ -cohomology of  $B_{\text{dR}}$ )

- (i) Calculate  $H^i(G_K, t^j B_{\text{dR}}^+)$  for  $i = 0, 1$  and for all  $j \geq 1$ .
- (ii) Calculate  $(B_{\text{dR}})^{G_K}$  and  $(B_{\text{dR}}^+)^{G_K}$ .

#### 4. DE RHAM REPRESENTATIONS

Let  $K/\mathbb{Q}_p$  be a finite extension and let  $\text{Rep}_{\mathbb{Q}_p}(G_K)$  denote the category of  $G_K$ -representations; i.e., finite dimensional  $\mathbb{Q}_p$ -vector spaces with a continuous action of  $G_K$ . Let  $\text{Fil}_K$  denote the category of *filtered  $K$ -vector spaces*; i.e., finite dimensional  $K$ -vector spaces  $D$  equipped with an *exhaustive* and *separated* filtration  $\{\text{Fil}^i(D)\}_{i \in \mathbb{Z}}$ . Being exhaustive means  $\text{Fil}^i(D) = D$  for  $i \ll 0$ , and being separated means  $\text{Fil}^i(D) = 0$  for  $i \gg 0$ .

Consider functor

$$\begin{aligned} D_{\text{dR}} : \text{Rep}_{\mathbb{Q}_p}(G_K) &\rightarrow \text{Fil}_K \\ V &\mapsto (V \otimes_{\mathbb{Q}_p} B_{\text{dR}})^{G_K} \end{aligned}$$

The filtration on  $D_{\text{dR}}(V)$  is given by  $\text{Fil}^i(D_{\text{dR}}(V)) := (V \otimes_{\mathbb{Q}_p} t^i B_{\text{dR}}^+)^{G_K}$ .

It is always true that  $\dim_K D_{\text{dR}}(V) \leq \dim_{\mathbb{Q}_p} V$ . We say  $V$  is *de Rham* if this is an equality. The subcategory of de Rham representations is denoted by  $\text{Rep}_{\mathbb{Q}_p}^{\text{dR}}(G_K)$ .

**Theorem 4.1.** (i) *The functor*

$$D_{\text{dR}} : \text{Rep}_{\mathbb{Q}_p}^{\text{dR}}(G_K) \rightarrow \text{Fil}_K$$

*is exact and faithful (but not full!) Moreover, it respects direct sums, tensor products, subobjects, quotients, and duals.*

(ii) *If  $V$  is de Rham, the natural map*

$$\alpha_{\text{dR}, V} : D_{\text{dR}}(V) \otimes_K B_{\text{dR}} \rightarrow V \otimes_{\mathbb{Q}_p} B_{\text{dR}}$$

*is an isomorphism of filtered vector spaces.*

The notion of *Hodge-Tate* representations can be defined in the same fashion. The *Hodge-Tate period ring* is defined to be

$$B_{\text{HT}} = \bigoplus_{n \in \mathbb{Z}} \mathbb{C}_p(n)$$

where  $\mathbb{C}_p(n)$  stands for the Tate twist. For any  $V \in \text{Rep}_{\mathbb{Q}_p}(G_K)$ , we can consider functor

$$D_{\text{HT}} : \text{Rep}_{\mathbb{Q}_p}(G_K) \rightarrow \text{Vect}_K.$$

A representation  $V$  is called *Hodge-Tate* if  $\dim_K D_{\text{HT}}(V) = \dim_{\mathbb{Q}_p} V$ .

**Theorem 4.2.** *De Rham representations are Hodge-Tate.*

Important source of de Rham representations: those  $G_K$ -representations arising from  $p$ -adic étale cohomologies of proper smooth varieties over  $K$  are de Rham.

**Problem 14.** Prove Theorem 4.2.

**Problem 15.** Let  $V \in \text{Rep}_{\mathbb{Q}_p}(G_K)$  and let  $n \in \mathbb{Z}$ . Prove that  $V$  is de Rham if and only if  $V \otimes_{\mathbb{Q}_p} \mathbb{Q}_p(n)$  is de Rham.

**Problem 16.** Let  $K'/K$  be a finite extension and let  $V \in \text{Rep}_{\mathbb{Q}_p}(G_K)$ . Show that  $V$  is de Rham as a  $G_K$ -representation if and only if it is de Rham viewed as a  $G_{K'}$ -representations.

**Problem 17.** Suppose  $V \in \text{Rep}_{\mathbb{Q}_p}(G_K)$  is 1-dimensional. Prove that  $V$  is de Rham if and only if it is Hodge-Tate.

**Problem 18.** Let  $\eta : G_K \rightarrow \mathbb{Z}_p^\times$  be a continuous character. Show that  $\mathbb{Q}_p(\eta)$  is de Rham (equivalently, Hodge-Tate) if and only if there exists  $n \in \mathbb{Z}$  such that  $\chi^n \eta$  is *potentially unramified*. (A character of  $G_K$  is called *potentially unramified* if there exists a finite extension  $L/K$  such that the image of  $I_L$  is trivial.)

**Problem 19.** (Tate curve)

Let  $K/\mathbb{Q}_p$  be a finite extension and let  $q \in K^\times$  be an element such that  $|q| < 1$ . Let  $q^\mathbb{Z} = \{q^n \mid n \in \mathbb{Z}\}$  and consider quotient group

$$E_q = \overline{K}^\times / q^\mathbb{Z} \quad (\text{“Tate curve”})$$

The abelian group  $E_q$  has a natural action of  $G_K$ . For each  $n \geq 0$ , let  $E_q[p^n]$  be the subgroup of  $p^n$ -torsion elements. Define the *Tate module*

$$T_p(E_q) := \varprojlim_n E_q[p^n]$$

with transition maps being multiplication by  $p$ . Inverting  $p$ , we obtain the *rational Tate module*

$$V_p(E_q) := T_p(E_q) \otimes_{\mathbb{Z}_p} \mathbb{Q}_p.$$

- (i) For each  $n$ , choose a primitive  $p^n$ -th root of unity  $\zeta_{p^n}$  and choose a  $p^n$ -th root  $\lambda_n$  of  $q$  in  $\overline{K}^\times$ . Show that

$$\begin{aligned} (\mathbb{Z}/p^n\mathbb{Z})^2 &\rightarrow E_q[p^n] \\ (a, b) &\mapsto \zeta_{p^n}^a \lambda_n^b \end{aligned}$$

is an isomorphism.

- (ii) Show that  $V_p(E_q)$  is a 2-dimensional  $\mathbb{Q}_p$ -vector space equipped with a continuous action of  $G_K$ .  
 (iii) Show that  $V_p(E_q)$  is an extension of  $\mathbb{Q}_p$  by  $\mathbb{Q}_p(1)$ .

$$0 \rightarrow \mathbb{Q}_p(1) \rightarrow V_p(E_q) \rightarrow \mathbb{Q}_p \rightarrow 0$$

- (iv)  $V_p(E_q)$  has an explicit basis  $\{e, f\}$  where

$$e = (1, \zeta_p, \zeta_{p^2}, \dots), \quad f = (q, q^{1/p}, q^{1/p^2}, \dots).$$

For any  $g \in G_K$ , show that  $g(e) = \chi(g)e$ ,  $g(f) = f + a(g)e$  for some  $a(g) \in \mathbb{Z}_p$  depending on  $g$ .

- (v) Recall that  $t = \log[\varepsilon] \in B_{\text{dR}}^+$ . Let  $q^{\flat} = (q, q^{1/p}, \dots) \in \mathcal{O}_{\mathbb{C}_p^\flat}$ . We can define “ $\log[q^{\flat}]$ ” as follows.

$$\log[q^{\flat}] := \log_p(q) + \sum_{n=1}^{\infty} (-1)^{n-1} \frac{([q^{\flat}]/q - 1)^n}{n}.$$

Check that  $\log[q^{\flat}]$  converges in  $B_{\text{dR}}^+$ .

- (vi) Let  $u = \log[q^{\flat}]$ . Show that  $g(u) = u + a(g)t$ .  
 (vii) Show that  $V_p(E_q)$  is de Rham.  
 (Hint: Use  $t$  and  $u$  to modify the basis  $e \otimes 1, f \otimes 1$  of  $V_p(E_q) \otimes_{\mathbb{Q}_p} B_{\text{dR}}$  into a  $G_K$ -invariant one.)

**Problem 20.** Let  $n, m$  be two positive integers and  $n \neq m$ . Let  $V$  be any extension

$$0 \rightarrow \mathbb{Q}_p(n) \rightarrow V \rightarrow \mathbb{Q}_p(m) \rightarrow 0$$

in  $\text{Rep}_{\mathbb{Q}_p}(G_K)$ . Show that

- (i)  $V$  is Hodge-Tate.  
 (ii)  $V$  is de Rham if  $n > m$ .

(On the other hand, every non-trivial extension

$$0 \rightarrow \mathbb{Q}_p \rightarrow V \rightarrow \mathbb{Q}_p(1) \rightarrow 0$$

is not de Rham. But this is difficult to prove.)

**Problem 21.** In this problem, we prove that the functor  $D_{\text{dR}} : \text{Rep}_{\mathbb{Q}_p}^{\text{dR}}(G_K) \rightarrow \text{Fil}_K$  is not full.

- (i) For  $V, W \in \text{Rep}_{\mathbb{Q}_p}^{\text{dR}}(G_K)$ , show that  $D_{\text{dR}}(V)$  and  $D_{\text{dR}}(W)$  are isomorphic in  $\text{Fil}_K$  if and only if

$$\dim_K \text{gr}^i(D_{\text{dR}}(V)) = \dim_K \text{gr}^i(D_{\text{dR}}(W))$$

for all  $i$ . (i.e., they have the same Hodge-Tate weights and Hodge-Tate numbers.)

- (ii) Show that there exists a non-split extension of  $\mathbb{Q}_p$  by  $\mathbb{Q}_p(1)$  in  $\text{Rep}_{\mathbb{Q}_p}^{\text{dR}}(G_K)$ .  
 (iii) Conclude that  $D_{\text{dR}}$  is not full.

### 5. CRYSTALLINE PERIOD RING $B_{\text{crys}}$

Let  $K/\mathbb{Q}_p$  be a finite extension with residue field  $k$ . Let  $K_0 = W(k)[\frac{1}{p}]$ . We will construct period ring  $B_{\text{crys}}$  equipped with both a filtration and a  $\varphi$ -action.

Recall that  $\xi = [p^b] - p$ . Consider

$$A_{\text{crys}}^0 = W(\mathcal{O}_{\mathbb{C}_p^b}) \left[ \frac{\xi^m}{m!} \right]_{m \geq 1} \subset W(\mathcal{O}_{\mathbb{C}_p^b}) \left[ \frac{1}{p} \right].$$

This is a  $G_K$ -stable  $W(\mathcal{O}_{\mathbb{C}_p^b})$ -subalgebra generated by “divided-powers”. Define

$$A_{\text{crys}} = \varprojlim_n A_{\text{crys}}^0 / p^n A_{\text{crys}}^0$$

with  $p$ -adic topology. We can fill in the top arrow in the commutative diagram

$$\begin{array}{ccc} A_{\text{crys}} & \longrightarrow & B_{\text{dR}}^+ \\ \uparrow & & \uparrow \\ A_{\text{crys}}^0 & \longrightarrow & W(\mathcal{O}_{\mathbb{C}_p^b}) \left[ \frac{1}{p} \right] \end{array}$$

and then identify  $A_{\text{crys}}$  with a subring of  $B_{\text{dR}}^+$ . More precisely,

$$A_{\text{crys}} = \left\{ \sum_{n=0}^{\infty} a_n \frac{\xi^n}{n!} \mid a_n \in W(\mathcal{O}_{\mathbb{C}_p^b}), a_n \rightarrow 0 \text{ } p\text{-adically} \right\}$$

Define  $B_{\text{crys}}^+ = A_{\text{crys}} \left[ \frac{1}{p} \right] \subset B_{\text{dR}}^+$ . Since  $t \in A_{\text{crys}}$ , we can define

$$B_{\text{crys}} = B_{\text{crys}}^+ \left[ \frac{1}{t} \right] \subset B_{\text{dR}}^+ \left[ \frac{1}{t} \right] \subset B_{\text{dR}}$$

equipped with subspace topology from the new topology on  $B_{\text{dR}}$  introduced in Problem 11. Moreover,  $B_{\text{crys}}$  admits a natural action of  $G_K$ . There is a  $G_K$ -equivariant injection  $K \otimes_{K_0} B_{\text{crys}} \rightarrow B_{\text{dR}}$ . Consequently,  $B_{\text{crys}}^{G_K} = K_0$ .

The filtrations on  $B_{\text{crys}}$  are the ones inherited from  $B_{\text{dR}}$ . Namely,  $\text{Fil}^i B_{\text{crys}} = \text{Fil}^i B_{\text{dR}} \cap B_{\text{crys}}$ . Unlike  $B_{\text{dR}}$ , the  $\varphi$ -action extends to  $A_{\text{crys}}^0$ , and hence on  $A_{\text{crys}}$ ,  $B_{\text{crys}}^+$ ,  $B_{\text{crys}}$ . (One can verify that  $\varphi(t) = pt$ .) However, the filtrations are not  $\varphi$ -stable.

**Theorem 5.1.**  $\varphi : A_{\text{crys}} \rightarrow A_{\text{crys}}$  is injective.

**Theorem 5.2.** We have “fundamental exact sequences”

$$0 \rightarrow \mathbb{Q}_p \rightarrow B_{\text{crys}}^{\varphi=1} \rightarrow B_{\text{dR}}/B_{\text{dR}}^+ \rightarrow 0$$

$$0 \rightarrow \mathbb{Q}_p \rightarrow \mathrm{Fil}^0 B_{\mathrm{crys}} \xrightarrow{\varphi-1} B_{\mathrm{crys}} \rightarrow 0$$

The proof of these two fundamental results are difficult.

**Problem 22.**

- (i) Check that  $t \in A_{\mathrm{crys}}$  and  $t^{p-1} \in pA_{\mathrm{crys}}$ . Consequently,  $\frac{t^p}{p!} \in A_{\mathrm{crys}}$ .
- (ii) Show that for any  $a \in \ker(A_{\mathrm{crys}} \rightarrow \mathcal{O}_{\mathbb{C}_p})$ , we have  $\frac{a^m}{m!} \in A_{\mathrm{crys}}$ ,  $\forall m \geq 1$ .

**Problem 23.** Consider the  $G_K$ -equivariant injection  $K \otimes_{K_0} B_{\mathrm{crys}} \hookrightarrow B_{\mathrm{dR}}$ . Give left hand side the subspace filtration. Show that the induced map on the graded algebras is an isomorphism.

**Problem 24.** Check that  $A_{\mathrm{crys}}^0$  is  $\varphi$ -stable.

**Problem 25.**

- (i) Show that  $B_{\mathrm{crys}}^+ \subset \mathrm{Fil}^0 B_{\mathrm{crys}}$ .
- (ii) In this exercise, we show  $B_{\mathrm{crys}}^+ \neq \mathrm{Fil}^0 B_{\mathrm{crys}}$ . Consider

$$\alpha = \frac{[\varepsilon^{1/p}] - 1}{[\varepsilon^{1/p^2}] - 1}.$$

Show that  $\alpha \in B_{\mathrm{crys}}$ ,  $\frac{1}{\alpha} \in B_{\mathrm{crys}} \cap B_{\mathrm{dR}}^+$ , but  $\frac{1}{\varphi(\alpha)} \notin B_{\mathrm{dR}}^+$ . (This implies  $\frac{1}{\alpha} \in \mathrm{Fil}^0 B_{\mathrm{crys}} - B_{\mathrm{crys}}^+$ .)

**Problem 26.** Show that  $\varphi$  on  $B_{\mathrm{crys}}$  does not preserve filtrations.

**Problem 27.** As pointed out in [Col], the topology on  $B_{\mathrm{crys}}$  is unpleasant. In particular, the subspace topology inherited from  $B_{\mathrm{crys}}$  is different from the one on  $B_{\mathrm{crys}}^+$ . Let  $\omega = ([\varepsilon] - 1)/([\varepsilon^{1/p}] - 1)$  and consider

$$x_n = \frac{\omega^{p^n}}{(p^n - 1)!}$$

- (i) Show that  $(x_n)_{n \geq 0}$  does not converge to 0 in  $B_{\mathrm{crys}}^+$ .
- (ii) Show that  $(\omega x_n)_{n \geq 0}$  does converge to 0 in  $B_{\mathrm{crys}}^+$  and hence  $(x_n)_{n \geq 0}$  converges to 0 in  $B_{\mathrm{crys}}$ .

**Problem 28.** A remedy to the topology issue in Problem 27 is to introduce  $B_{\mathrm{max}}$ . Define

$$A_{\mathrm{max}} = \left\{ \sum_{n=0}^{\infty} a_n \frac{\omega^n}{p^n} \mid a_n \in W(\mathcal{O}_{\mathbb{C}_p}), a_n \rightarrow 0 \text{ } p\text{-adically} \right\}$$

and let  $B_{\max}^+ = A_{\max}[\frac{1}{p}] \subset B_{\mathrm{dR}}^+$ ,  $B_{\max} = B_{\max}^+[\frac{1}{t}] \subset B_{\mathrm{dR}}$ . Similar to  $B_{\mathrm{crys}}$ , the ring  $B_{\max}$  is equipped with  $G_K$ -action,  $\varphi$ -action, and filtration.

- (i) Show that  $B_{\max}$  does not have the issue in Problem 27.
- (ii) Show that  $B_{\max}^{G_K} = K_0$ .
- (iii) Show that  $A_{\max}^{\varphi=1} = \mathbb{Z}_p$ . Hence  $(B_{\max}^+)^{\varphi=1} = \mathbb{Q}_p$ .
- (iv) Show that  $\varphi(B_{\max}) \subset B_{\mathrm{crys}} \subset B_{\max}$ .
- (v) (Hard!) Prove the analogue of Theorem 5.2: The following sequences are exact

$$\begin{aligned} 0 &\rightarrow \mathbb{Q}_p \rightarrow B_{\max}^{\varphi=1} \rightarrow B_{\mathrm{dR}}/B_{\mathrm{dR}}^+ \rightarrow 0 \\ 0 &\rightarrow \mathbb{Q}_p \rightarrow \mathrm{Fil}^0 B_{\max} \xrightarrow{\varphi^{-1}} B_{\max} \rightarrow 0 \end{aligned}$$

## 6. CRYSTALLINE REPRESENTATIONS

Let  $\mathrm{MF}_K^\varphi$  denote the category of triples  $(D, \varphi_D, \mathrm{Fil}^\bullet)$  where

- $D$  is a  $K_0$ -vector space
- $\varphi_D : D \rightarrow D$  is a bijective  $\varphi$ -semilinear endomorphism
- $\mathrm{Fil}^\bullet$  is a filtration on  $D_K = D \otimes_{K_0} K$  such that  $(D_K, \mathrm{Fil}^\bullet)$  is an object in  $\mathrm{Fil}_K$ .

Objects in  $\mathrm{MF}_K^\varphi$  are called *filtered  $\varphi$ -modules*.

Consider functor

$$\begin{aligned} D_{\mathrm{crys}} : \mathrm{Rep}_{\mathbb{Q}_p}(G_K) &\rightarrow \mathrm{MF}_K^\varphi \\ V &\mapsto (V \otimes_{\mathbb{Q}_p} B_{\mathrm{crys}})^{G_K} \end{aligned}$$

It is always true that  $\dim_{K_0} D_{\mathrm{crys}}(V) \leq \dim_{\mathbb{Q}_p} V$ . We say  $V$  is *crystalline* if  $\dim_{K_0} D_{\mathrm{crys}}(V) = \dim_{\mathbb{Q}_p} V$ . The category of crystalline representations is denoted by  $\mathrm{Rep}_{\mathbb{Q}_p}^{\mathrm{crys}}(G_K)$ .

**Theorem 6.1.** (i) *The functor*

$$D_{\mathrm{crys}} : \mathrm{Rep}_{\mathbb{Q}_p}^{\mathrm{crys}}(G_K) \rightarrow \mathrm{MF}_K^\varphi$$

*is exact and fully faithful. Moreover, it preserves direct sums, tensor products, subobjects, quotients, and duals.*

(ii) *If  $V$  is crystalline, the natural map*

$$\alpha_{\mathrm{crys}, V} : D_{\mathrm{crys}}(V) \otimes_{K_0} B_{\mathrm{crys}} \rightarrow V \otimes_{\mathbb{Q}_p} B_{\mathrm{crys}}$$

*is an isomorphism of filtered  $\varphi$ -modules.*

(iii) *If  $V$  is crystalline, we can recover  $V$  from  $D_{\mathrm{crys}}(V)$  by*

$$V = \mathrm{Fil}^0(D_{\mathrm{crys}}(V) \otimes_{K_0} B_{\mathrm{crys}})^{\varphi=1}.$$

**Theorem 6.2.** *Crystalline representations are de Rham.*

Source of crystalline representations: those  $G_K$ -representations arising from  $p$ -adic étale cohomologies of proper smooth varieties over  $K$  with *good reduction* are crystalline.

**Problem 29.** Describe  $D_{\text{crys}}(\mathbb{Q}_p(n))$  explicitly.

**Problem 30.** Let  $\eta : G_K \rightarrow \mathbb{Q}_p^\times$  be a continuous character. Show that  $\mathbb{Q}_p(\eta)$  is crystalline if and only if there exists  $n \in \mathbb{Z}$  such that  $\chi^n \eta$  is an unramified character.

**Problem 31.** Let  $D$  be a finite dimensional  $K_0$ -vector space and let  $\varphi_D : D \rightarrow D$  be an injective  $\varphi$ -semilinear morphism. Prove that  $\varphi_D$  is automatically bijective.

**Problem 32.** Similar to  $D_{\text{dR}}$  and  $D_{\text{crys}}$ , we can consider

$$D_{\text{max}} : \text{Rep}_{\mathbb{Q}_p}(G_K) \rightarrow \text{MF}_K^\varphi$$

$$V \mapsto (V \otimes_{\mathbb{Q}_p} B_{\text{max}})^{G_K}$$

It is always true that  $\dim_{K_0} D_{\text{max}}(V) \leq \dim_{\mathbb{Q}_p} V$ . We say  $V$  is  $B_{\text{max}}$ -admissible if  $\dim_{K_0} D_{\text{max}}(V) = \dim_{\mathbb{Q}_p} V$ .

Prove that  $V$  is  $B_{\text{max}}$ -admissible if and only if it is crystalline.

**Problem 33.** Let  $V_p(E_q)$  be the representation studied in Problem 19.

- (i) Is  $V_p(E_q)$  crystalline?
- (ii) Describe  $D_{\text{crys}}(V_p(E_q))$  explicitly.

**Problem 34.**(Hard!)

- (i) Can you find an extension

$$0 \rightarrow \mathbb{Q}_p(1) \rightarrow V \rightarrow \mathbb{Q}_p \rightarrow 0$$

so that  $V$  is de Rham but not crystalline?

- (ii) Show that any extension

$$0 \rightarrow \mathbb{Q}_p(n) \rightarrow V \rightarrow \mathbb{Q}_p \rightarrow 0$$

for  $n \geq 2$  must be crystalline.

## 7. PERIOD SHEAVES

This section dedicates to our first attempt on “relative period rings”. We define  $\mathbb{B}_{\text{dR}}$  as a sheaf on the *pro-étale site* of adic spaces.

Let  $X$  be a locally noetherian adic space over  $\text{Spa}(\mathbb{Q}_p, \mathbb{Z}_p)$ . The objects in the *pro-étale site*  $X_{\text{proét}}$  are inverse systems

$$\varprojlim_{i \in I} U_i \rightarrow X$$

where  $U_i \in X_{\text{ét}}$  and the transition maps  $U_j \rightarrow U_i$  are finite étale surjective. The coverings are the topological ones. For details, the readers are referred to [Sch2]. One important property is that affinoid perfectoid objects in  $X_{\text{proét}}$  form a basis

for the pro-étale topology. Let  $\mathcal{B}$  denote the collection of such objects. To define a sheaf, we only need to define a presheaf on  $\mathcal{B}$ .

To this end, we first define the period rings on affinoid perfectoids. Let  $(L, L^+)$  be a perfectoid field of characteristic 0. For any perfectoid affinoid  $(L, L^+)$ -algebra  $(R, R^+)$ , we define

$$\begin{aligned} \mathbb{A}_{\text{inf}}(R, R^+) &:= W(R^{b+}) \\ \mathbb{B}_{\text{inf}}(R, R^+) &:= \mathbb{A}_{\text{inf}}(R, R^+) \left[ \frac{1}{p} \right] \\ \mathbb{B}_{\text{dR}}^+(R, R^+) &:= \varprojlim_n \mathbb{B}_{\text{inf}}(R, R^+) / (\ker \theta)^n \end{aligned}$$

where  $\theta : \mathbb{A}_{\text{inf}}(R, R^+) = W(R^{b+}) \rightarrow R^+$  is defined in the same way as in Section 3. Notice that  $\xi$  is a generator of  $\theta$  (see Problem 35). We define  $\mathbb{B}_{\text{dR}}(R, R^+) = \mathbb{B}_{\text{dR}}^+(R, R^+) \left[ \frac{1}{\xi} \right]$ . The filtration on  $\mathbb{B}_{\text{dR}}$  is given by  $\text{Fil}^i \mathbb{B}_{\text{dR}} = \xi^i \mathbb{B}_{\text{dR}}^+$ ,  $i \in \mathbb{Z}$ .

Back to the pro-étale site. We define a presheaf  $\mathcal{F}_{\mathbb{A}_{\text{inf}}}$  (resp.,  $\mathcal{F}_{\mathbb{B}_{\text{inf}}}$ ,  $\mathcal{F}_{\mathbb{B}_{\text{dR}}^+}$ ,  $\mathcal{F}_{\mathbb{B}_{\text{dR}}}$ ) on  $\mathcal{B}$  by sending  $U = \text{Spa}(R, R^+)$  to  $\mathbb{A}_{\text{inf}}(R, R^+)$  (resp.,  $\mathbb{B}_{\text{inf}}(R, R^+)$ ,  $\mathbb{B}_{\text{dR}}^+(R, R^+)$ ,  $\mathbb{B}_{\text{dR}}(R, R^+)$ ). Finally, define  $\mathbb{A}_{\text{inf}}$  (resp.,  $\mathbb{B}_{\text{inf}}$ ,  $\mathbb{B}_{\text{dR}}^+$ ,  $\mathbb{B}_{\text{dR}}$ ) to be the corresponding sheafifications.

These period sheaves played a central role in proving a de Rham comparison for rigid analytic varieties [Sch2]. Crystalline analogues are studied in [BMS], [TT]. Following the same spirit, sheaf versions of Robba rings and  $(\varphi, \Gamma)$ -modules are studied in [KL1], [KL2].

**Problem 35.** For any perfectoid affinoid  $(L, L^+)$ -algebra  $(R, R^+)$ , show that the kernel of  $\theta : \mathbb{A}_{\text{inf}}(R, R^+) \rightarrow R^+$  is a principle ideal generated by some  $\xi \in \mathbb{A}_{\text{inf}}(L, L^+)$ .

**Problem 36.**

- (i) Show that the presheaf  $\mathcal{F}_{\mathbb{A}_{\text{inf}}}$  on  $\mathcal{B}$  satisfies sheaf properties. In particular,  $\mathbb{A}_{\text{inf}}(U) = \mathbb{A}_{\text{inf}}(R, R^+)$ , and  $\mathbb{A}_{\text{inf}} = W(\widehat{\mathcal{O}}_{X_{\text{proét}}}^+)$ .
- (ii) Show that  $H^i(U, \mathbb{A}_{\text{inf}})$  is almost zero for all  $i > 0$ .
- (iii) Show that  $H^i(U, \mathbb{B}_{\text{dR}}^+) = 0$  for all  $i > 0$ . (Hint:  $[p^b]$  is invertible in  $\mathbb{B}_{\text{dR}}^+$ .)

**Problem 37.**

- (i) Construct period sheaves  $\mathbb{A}_{\text{crys}}^0, \mathbb{A}_{\text{crys}}, \mathbb{B}_{\text{crys}}^+, \mathbb{B}_{\text{crys}}, \mathbb{B}_{\text{max}}^+, \mathbb{B}_{\text{max}}$  on  $X_{\text{proét}}$  in the same way. Repeat Problem 36(i).
- (ii) Show that  $H^i(U, \mathbb{A}_{\text{crys}}^0)$  and  $H^i(U, \mathbb{A}_{\text{crys}})$  are almost zero for all  $i > 0$ .
- (iii) Show that  $H^i(U, \mathbb{B}_{\text{crys}}^+) = 0$  for all  $i > 0$ .
